

A/B Test Results

Subscription Screen Optimization

Test Description

Problem:	The need to improve subscription screen efficiency to drive revenue growth
Test Object:	Subscription checkout screen
Target Audience:	All users who reached the payment screen
Group A (Control):	Standard subscription screen at \$4.99
Group B (Variant):	Subscription screen at \$4.99 with a visual emphasis on a "50% Discount" label
Target Metric:	Install-to-Paid Conversion Rate (CR)

Hypotheses

Null Hypothesis (H_0)

Adding "50% discount" information to the subscription screen will not affect the purchase conversion rate; any observed difference between the variants will be statistically insignificant

Alternative Hypothesis (H_1)

Users who see the "50% discount" offer (at the same \$4.99 price point) will purchase the subscription more frequently due to the psychological framing of the deal, leading to a significant increase in the install-to-paid conversion rate

Group Size and Conversion Rate

Groups	Users	Conversions	Conversion Rate (CR)	Abs. Difference	Rel. Difference (Lift)
Group A (Control)	10 013	611	6.1%	—	—
Group B (Variant)	9 985	889	8.9%	+ 2.8 p.p.	+45,9%

Test Duration

Start Date
2023-07-03

End Date
2023-07-25

Duration
21 days

Statistical Tests

Z-test

Statistic value:

$Z = 7.52$

P-value:

p-value ≈ 0.000

Null Hypothesis (H_0) rejected

Chi-squared test (χ^2)

Statistic value:

$\chi^2 = 56.14$

P-value:

p-value = 6.7×10^{-14}

Null Hypothesis (H_0) rejected

Conclusion:

Since in both cases the p-value is significantly lower than the significance level $\alpha=0.05$, we reject the null hypothesis. The difference between the groups is statistically significant.

CR Comparison with 95% Confidence Intervals

The chart clearly indicates that the conversion rate for Group B is significantly higher. The confidence intervals do not overlap, which visually confirms the statistical significance of the test's success

Cumulative Conversion Rate Chart

The chart shows a consistent advantage of Variant B over Variant A throughout the entire test period

A/B Test Results & Conclusions

Test Result:	Variant B (with the "-50%" label) showed a significant advantage, increasing the conversion rate from 6.1% to 8.9%.
Efficiency:	Achieved a +46% relative conversion uplift for the target metric without changing the product cost.
Statistical Reliability:	The difference is statistically significant ($p\text{-value} < 0.05$). The null hypothesis was rejected.
Стабільність:	Variant B's cumulative CR consistently remained higher than the control group throughout the entire 21-day test period.
Stability:	Roll out Variant B to 100% of the app's users.
Next Steps::	Use the discovered insight regarding discount effectiveness to generate new hypotheses, such as testing a limited-time offer timer.
